Nobody understands quantum mechanics either. Every line of thought on the relationship of consciousness to physics runs into deep trouble.

## Quantum Physics Experiment Suggests That Reality Isn't Objective

In classical physics the answer seems to be yes, things have a definite state and that state can be (in principle) completely known by means of measurements.

All atomic nuclei, like the fundamental particles that make them up, have a quantum-mechanical property called spin. This experiment played a major role in the general acceptance of the wave theory of light.

All the same, he is wary of being associated with the earlier ideas about "quantum consciousness", which he sees as highly speculative at best. Wave Mechanics. Contrary to classical mechanics, one can never make simultaneous predictions of conjugate variables such as position and momentum, to arbitrary precision.

Besides, most researchers think that the Orch-OR idea was ruled out by a study discovered in the laboratories, this energy, when observed, acts in exact proportion to the way that it is "believed" that it will act and will provide a physical appearance based on the "perception" of the thinker. The implication seems to be that each particle passes simultaneously through both slits and interferes with .
