Data from HCS experiments is federated together with data about i samples, such as sample type, annotations indicating cell type, control type and so on; ii data about the cells used, how the plate preparation was performed as well as information about dyes, antibodies and other reagents; iii gene sequence data and other functional data from Medline MESH descriptors for example ; iv Pathway data and chemical structures also allow cell based SAR, pharmacophore modeling. This is due to many reasons, including relative ease of synthesis, generally high chemical stability, and more straightforward characterization of reactivity Drews, PharmGKBThorntal.
